The competition for places at Collegio Nuovo entails a two-part oral test, covering two disciplines chosen by the candidate and pertinent to her chosen degree course, as specified in the call for applications. For students enrolling on one of the courses at the University of Pavia that are taught in English, the oral test can also be conducted in English.

The topics listed below are broad indications which applicants should bear in mind when preparing for the test, whose main purpose is to ascertain their aptitude for and interest in the disciplines and, therefore, in the degree courses they intend to take. In addition, candidates may indicate one or more specific topics which they, personally, are interested in, and which they have studied in particular depth. These will be discussed at the start of the oral test. They will also be required to outline, for the Selection Committee, the content of their school curriculum. The Selection Committee will take into account the academic curriculum of the candidates who are enrolled as students in any of the subsequent years at the University of Pavia.

**HUMANITIES**

**ITALIAN**
Italian literature of the 19th and 20th centuries with reference, in particular, to the most important authors, texts and literary movements of the period and analysis of the philological and linguistic aspects of the works examined.

**HISTORY**
Discussion of the key issues and events of nineteenth and twentieth century history.

**PHILOSOPHY**
Philosophical thought from Kant onwards; applicants must have direct knowledge of at least one key philosophical text from the last two centuries.

**LATIN**
Interpretation and analysis of some texts of Latin authors, chosen by the candidate, who will also be required to refer to the history of Latin literature.
SCIENCES

MATHEMATICS
The fundamentals of Euclidean geometry of the plane: in particular congruence, similarity, the theory of the equivalence of polygons, the circumference length and the area of a circle. The main number sets, from natural numbers to real numbers; properties of mathematical operations and of order relations.
Equations, inequalities, linear and quadratic systems.
Elements of trigonometry with reference, in particular, to the definitions and properties of trigonometric functions.
Powers, radicals, exponentials, logarithms, and their properties.
Cartesian coordinates in the plane and graphical representation of the main first and second-order curves.
*Limits, derivatives and integrals with reference, in particular, to their properties and their applications, to the study of functions and to the calculation of areas and volumes (*only for candidates from Italian Scientific High Schools/Liceo Scientifico).

PHYSICS
Dynamics: the three principles of dynamics; inertial and non-inertial frames of reference; momentum, impulse, work and power.
The law of conservation of mechanical energy.
The universal law of gravitation and Kepler’s laws of planetary motion.
Kinetic energy and potential energy.
Thermodynamics: the concepts of temperature and heat; specific heat. First and second law of thermodynamics.
Coulomb’s law and the concept of electric charge.
Magnetic induction and electric currents.

CHEMISTRY
Inorganic chemistry: nomenclature of inorganic compounds. Metals and non-metals.
Organic chemistry: nomenclature of organic compounds. Hydrocarbons and the main classes of organic compounds.

BIOLOGY
Reproduction.
Cell organisation in prokaryotic and eukaryotic cells. Comparison of animal, plant and microbial cells. Basic functions of the cell: transport of substances through the cell membrane; cellular metabolism; protein synthesis. The nucleus and cell division. Mitosis
The human body: anatomy and physiology of the autonomic systems (digestive, respiratory, circulatory, excretory) and of the systems controlling the social aspects of life (endocrine, nervous, locomotor).

INFORMATION TECHNOLOGY
*Candidates already enrolled or eligible to enrol in Engineering can choose to undertake, in addition to an oral test on one of the disciplines mentioned above, a second test in IT.*
They are required to have a basic knowledge of the hardware and software of a computer.
Basic notions of:
Computer architecture.
Representation of alphanumeric information.
Laws of Boolean Algebra.
Man-computer interaction.
Networking and the Internet.
Programming and computer languages.
Algorithms and processing of data and texts.
Computer applications to everyday life.
Artificial intelligence and machine learning.
